

ADMAPS Framework Companion V1

Conceptual grounding for the ADMAPS Lifecycle Checklist

This document provides conceptual grounding for the ADMAPS Lifecycle Checklist. The checklist is designed for operational use in audits, design reviews, procurement, and evaluation of high-stakes public-sector algorithmic decision-making systems. This companion explains how to interpret the ADMAPS framework that underpins the checklist.

ADMAPS Framework

How to Read the Framework

The ADMAPS framework conceptualizes algorithmic systems as interventions embedded in public-sector decision-making rather than as standalone technical artifacts. It emphasizes that algorithmic outputs interact with professional judgment, organizational workflows, institutional data practices, and governance structures. The framework foregrounds how decisions are made in practice, where discretion is exercised, and how responsibility and accountability are distributed across actors.

The lifecycle stages represented in the framework correspond directly to the sections of the ADMAPS Lifecycle Checklist. Problem framing situates the algorithm within a specific decision context. Data and target construction reflect institutional processes that shape what the system learns. Use in practice captures how frontline workers encounter and respond to algorithmic outputs. Governance and oversight address accountability beyond abstract human-in-the-loop claims. Evaluation treats algorithmic systems as interventions whose impacts must be assessed over time.

Together, the framework and checklist support reflective, intervention-aware analysis of public-sector algorithmic systems. Users are encouraged to apply the checklist during audits or reviews and refer back to this framework companion for conceptual interpretation.
